Credit line increase: ship decision

1,000,000 members randomized ~50/50 at signup (500,226 control / 499,774 treatment), joined June to August 2026, snapshot 2026-08-25. Retention = account still open N days after joining, counting only members observed for the full N days. Differences in percentage points (pp), treatment minus control.

> **Decision: ship to members who have room to grow (max eligible > starting limit, ~77% of members). Members already at their maximum keep the control experience: no Increase button.** Also cap the slider at max eligible. Expected effect: about **+4.6 pp retention at 30 days and +5.7 pp at 60 days** across all members, vs. roughly 0 for shipping as-is.

Evidence

Shipping as-is looks flat (30-day retention: 87.8% control vs. 87.8% treatment). Splitting by **headroom** (max eligible minus starting limit) shows why. Headroom is set at signup, before assignment, so each band below is its own randomized comparison, with matching group sizes in every band:

Headroom	Share	Members (control / treatment)	14-day	30-day	60-day
$0 (at max)	23%	115,359 / 115,938	-25.7	-19.9	-18.1
$1 to $500	19%	96,106 / 95,794	+0.1	+6.3	+7.4
$501 to $1,500	38%	192,728 / 191,982	+0.0	+5.9	+7.6
$1,501+	19%	96,033 / 96,060	+0.0	+5.9	+7.3

Treatment minus control retention (pp). Every difference larger than 1 pp is outside the 95% CI; the 14-day differences for members with headroom are not significant.

- **Members with headroom gain.** In all three headroom bands, treatment retains 5.9 to 6.3 pp better at 30 days and 7.3 to 7.6 pp better at 60 days, with no early cost (even with control at 14 days). The effect is the same size regardless of how much headroom a member has.
- **Members at their max are hurt badly:** 18 to 26 pp lower retention at every window. Their max is fixed, so any request is above it, and every request above max was declined. For them the feature can only end in a decline.
- **The two effects cancel.** A gain of about 6 pp for 77% of members roughly equals a loss of about 20 pp for 23%, which is why the overall result is flat.
- **Expected impact of the decision:** members at their max stay at control retention; members with headroom keep their gain (weighted average +6.0 pp at 30 days, +7.5 pp at 60 days). Across all members: 76.8% x +6.0 = **+4.6 pp at 30 days**; 76.8% x +7.5 = **+5.7 pp at 60 days**.

Risks and caveats

- No credit-loss data. Higher limits for ~77% of members need delinquency and utilization guardrails at rollout.
- 60-day results come from June joiners only (~70k per group); the 30-day estimate is the safer one to quote.

Next experiments

- **1. Pre-approved offer for members with headroom (priority: ~77% of members).** A = current request flow with the slider capped at max; B = "You're approved for up to $X" with a one-tap increase. Primary metric: 30- and 60-day retention; guardrail: delinquency.
- **2. Honest message for members at their max (~23%).** A = no button (the shipped default); B = a clear "You're at your maximum limit" card with no credit check and no decline. Max eligible stays fixed, so no promise of future increases. Primary metric: 30-day retention.
